NexJ Systems Announces its People-Centred NexJ eHealth Suite

NexJ eHealth Suite's multiple platforms allow patients and providers to work together across the continuum of care to encourage health-conscious behaviours and promote wellness

Quebec City, June 1, 2009 — NexJ Systems Inc., a leading provider of innovative customer-centric enterprise solutions, today announces the launch of the NexJ eHealth Suite, a set of robust, scalable platforms for deploying people-centred health solutions.

Around the world today, the challenges facing healthcare are great. Quality of care across regions is variable and it is difficult to keep all providers up to date with the latest best practices. Patient safety is in jeopardy when one patient has multiple records with multiple providers, documenting multiple conditions, and prescribing multiple medications. The cost and scope of healthcare is escalating rapidly, straining already stretched healthcare resources. These problems are unacceptable and unsustainable.

To solve these problems, society needs to reduce the demands on the healthcare system. People-centred solutions reduce the demands on healthcare by putting health information in the hands of people, educating them about their options, and empowering them to take responsibility for their own wellness.

The NexJ eHealth Suite's sophisticated, model-driven architecture is specifically designed to enable people-centred health solutions. The multiple platforms of the NexJ eHealth Suite allow patients and providers to work together, across the continuum of care, to encourage health-conscious behaviours and promote wellness.

The NexJ eHealth Suite includes the following people-centred tools and platforms:

- **NexJ Universal Health Connector:** A smart on-ramp to a HIAL for legacy systems that enables interoperability based on global standards.
- **NexJ Registry Server:** Standards-based solution to integrate with and maintain jurisdictional registries and domain repositories.
- **NexJ Provider Health Platform:** Integrated view of patient data across providers and the continuum of care.
- **NexJ Consumer Health Platform:** People-centred health applications with a connected Personal Health Record.
- **NexJ mHealth Platform:** Wireless access to the Provider & Consumer Health Platforms from BlackBerry devices.
- **NexJ Analytics Server:** Analytical tools for evidence-based decision support using aggregated and de-personalized data.

- **NexJ Deployment Server:** Tools to rapidly develop, deploy, and manage NexJ application servers.

Applications available on the NexJ eHealth Suite today include:

- **NexJ Provider Credentialing** to manage the credentialing process for physicians and other health service providers in a jurisdiction or facility. Provider Credentialing manages the privileges that providers have at facilities. It also enables eHealth access control, so providers have access to the correct patient records.
- **NexJ Disease Screening** to manage a population-based screening, focused on proactive, outbound campaigns to encourage testing of those at risk. NexJ Disease Screening helps manage the process of identifying candidates, distributing tests, receiving test results, and ensuring that clients receive consistent follow-up as required.
- **NexJ Health Coach** leverages the power of the NexJ Provider, Consumer and mHealth Platforms working together to facilitate collaboration between providers and patients to encourage health-conscious behaviours and promote wellness. NexJ Health Coach supports personalized coaching programs for disease management, weight loss, and lifestyle management.

“Patients and providers want the same thing – overall health and well-being for the patient” says Dr. Kevin Leonard, Associate Professor of Health Policy, Management, and Evaluation at the University of Toronto. “Connected health systems are the key to achieving a system where there is one patient, one record.”

Dr. Vaughan Glover of the Canadian Association for People-Centred Health says, “Individuals are at the centre of health care; however, very few systems are built with the individual in mind. NexJ provides standards-based products that make it possible for individuals around the world to share their health information with any provider or trusted party, thus enabling a global journey to wellness.”

“I am thrilled that we’re able to provide a solution that will apply NexJ’s next generation, model-driven technology to solve the complex problems faced by healthcare providers today” says William M. Tatham, CEO of NexJ Systems. “NexJ’s vision for building globally interoperable, people-centred health solutions will provide healthcare organizations with the tools they need to lower costs, while increasing the quality of care and improving patient safety.”

About NexJ Systems Inc.

NexJ Systems Inc. is a leading provider of innovative, customer-centric enterprise solutions for financial services, insurance, and health. Targeting customers with sophisticated customization, integration, and scalability requirements, NexJ Systems is dedicated to building next generation interoperable, people-centred health solutions.
